MORBIDITY DATA FOR INDIVIDUAL STATIONS WITH COLORED STRENGTH OF 1000 OR MORE	39

WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 88ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. Troops in transit and certain small detachments are not required to submit reports; for this and other reasons, total strength of reporting units has been consistently about 1 percent below the actual strength of the Army in this country. The mean strength shown for individual stations is that of Army personnel attached or assigned for medical care and does not include organizations not on the post but dependent on the station for hospitalization.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or longer, except for certain cases carded for record only (chiefly venereal disease cases treated on a duty status, and deaths which occurred before admission to hospital or quarters). Admissions designated as "injury" comprise all traumatism other than battle casualties (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications as well as various types of wounds not due to enemy action). Under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties. All cases other than those of injury or battle casualty are classified as "disease."

Admission rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The average proportion of the daily strength of the command which is confined to hospital or quarters (mean number of non-effectives per thousand strength) is given in the summary table for the total United States and for each of the Service Commands. This ratio may not be significant when the strength of a Command is changing markedly or when a Command has a relatively large number of General Hospitals.

The number of enlisted men discharged during the week on Certificates of Disability for Discharge (CDD) are shown for individual stations. These data should be distinguished from the figures for "honorable discharges for physical and mental disqualification" assembled by The Adjutant General's Office; the latter include discharges for inaptness in addition to CDD's and are tabulated on a somewhat different basis (e.g., the April data represent April discharges processed by the AGO during April and May plus discharges prior to April which were processed in May).

MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 88ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 15 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of total beds authorized and total beds occupied.

Unless otherwise specified, beds authorized as shown in this report are defined in par. 36h of AR 40-1080, C 2. Total beds include expansion beds in addition to normal beds. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in the tabulations for individual stations.

Regional Hospitals are distinguished from Station Hospitals by the letters (RH) appearing after the name of the station. Likewise Convalescent Hospitals are denoted by the letters (CH).

In the case of General Hospitals there are shown, in addition, the number of Army patients admitted, the number disposed of during the week (by return to duty, transfer, death, CDD, or otherwise), and the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, subdivided by disease, injury, and battle casualty patients. The patient days of treatment are presented separately for hospital and for convalescent facilities. The bed capacity and beds occupied in convalescent facilities are also indicated.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station have not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

WEEKLY HEALTH REPORT

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATESAll Causes: Disease and Injury:

During the week ending 22 September 1944 the admission rate from all causes increased by about 2 percent to 590 per year per thousand strength. The current morbidity from all causes is the highest reported since the week ending 26 May 1944 but is about 15 percent lower than for the corresponding week of 1943.

Morbidity from all diseases combined increased to 521 per thousand or about 2 percent higher than the previous week's rate. The current admission rate from disease is more than 15 percent under that for the corresponding week of 1943.

The admission rate from injury increased somewhat to 69 per thousand, which is slightly below the experience for the year to date. Current morbidity from this cause is about 20 percent lower than during the corresponding period of 1943.

Respiratory Causes:

For the fourth consecutive week morbidity from colds, influenza, etc. increased significantly, the current week's rate being 88 per thousand in contrast with 84 per thousand for the previous week and a level of about 67 per thousand during the summer months. The admission rate for the current week is about 5 percent lower than for the corresponding week of 1943, during which one of the lowest admission rates (in 1943) from these causes was registered.

The admission rate from pneumonia increased to 7 per thousand and was at the highest point since the middle of July; however, morbidity from this cause

continues somewhat below that experienced during the corresponding week of 1943.

Common Communicable Diseases:

Morbidity from venereal diseases, excluding cases contracted prior to entry into active service, increased sharply to a rate of 40 per thousand, which is the highest rate recorded during the past two years. Morbidity from these causes is about 40 percent higher than for the corresponding week of 1943.

Morbidity from diarrhea and dysentery was reported at 8 per thousand, which is the lowest rate experienced since the middle of May; the downward seasonal trend anticipated for this cause of morbidity has apparently set in. The admission rate from this cause for the current week was about 40 percent lower than for the corresponding week of 1943.

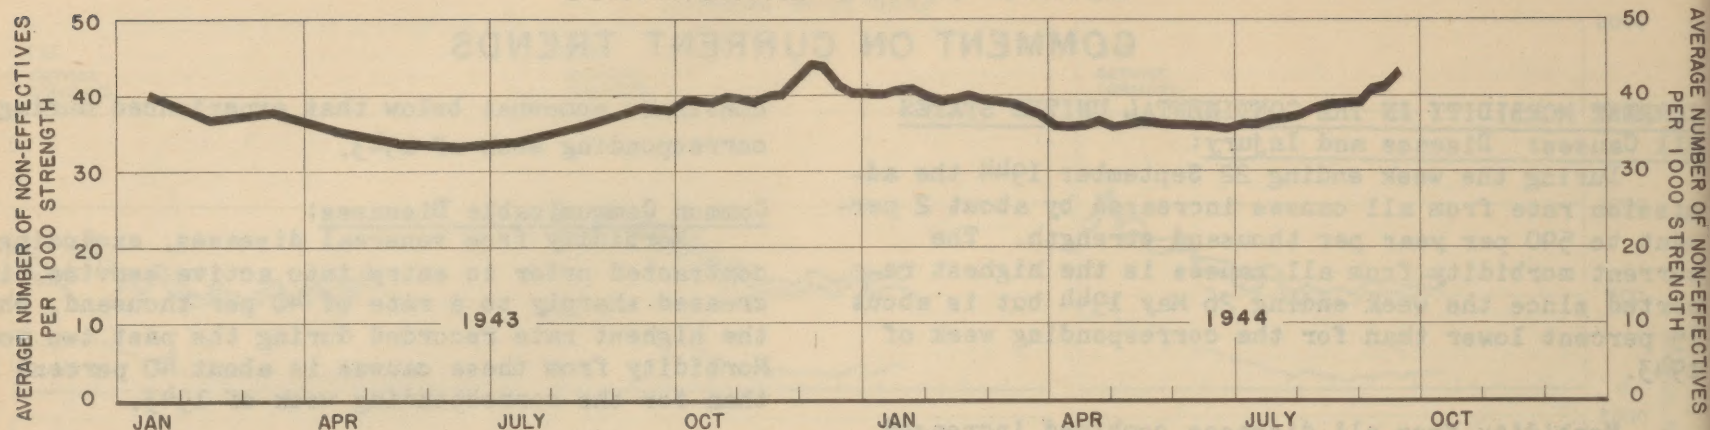

The number of new cases of meningitis was reported at 14, which is the lowest number for any week so far this year. The number of new cases of rheumatic fever also decreased; the current figure of 44 cases for the week is the lowest recorded this year. During the current week the new cases of poliomyelitis numbered 8 as compared with 11 cases the previous week and 5 and 12 cases respectively during the preceding two weeks.

VARIATIONS IN MORBIDITY BY SERVICE COMMANDAll Causes: Disease and Injury:

The admission rate from disease increased moderately in most Service Commands, but in no case did the rise exceed 5 percent; increases of almost this magnitude occurred in the Eighth and Ninth Service Commands. The only Service Command showing a significant decrease

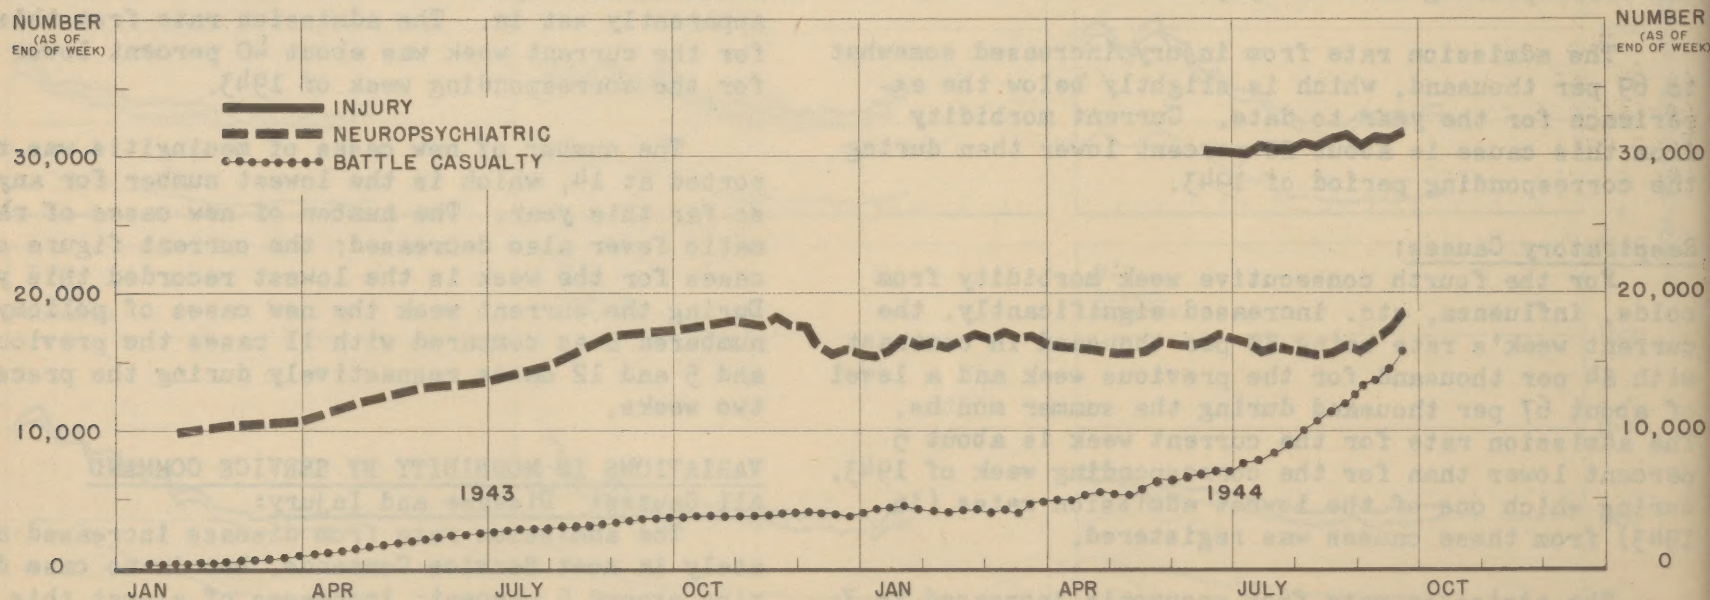

NON-EFFECTIVE RATE

CONTINENTAL UNITED STATES

PATIENTS REMAINING UNDER TREATMENT

CONTINENTAL UNITED STATES

COMMENT ON CURRENT TRENDS (CONT'D)

in morbidity was the First.

The Fifth Service Command again reported the highest morbidity from all causes (709 per thousand) and from disease (626 per thousand). The lowest morbidity from all causes (533 per thousand) and from disease (474 per thousand) was registered in the Seventh Service Command; for the first time in eight weeks the Eighth Service Command did not experience the lowest admission rate from disease, although it was only slightly above the Seventh Service Command in this respect.

Most Service Commands reported higher admission rates from injury; only in the Third and Ninth Service Commands were decreases recorded. The largest increases were reported by the First and Fourth Service Commands and the Military District of Washington. The Fifth Service Command, with a rate of 83 per thousand, again reported the highest admission rate from injury, while the Third and Sixth Service Commands and the Military District of Washington, with rates of about 50 per thousand, were the lowest.

Respiratory Causes:

The admission rate from colds, influenza, etc. increased in all Service Commands except the Second, Third, and Sixth. The sharpest increases were reported by the Fifth and Ninth Service Commands and the Military District of Washington.

For the first time in several weeks the highest morbidity from colds, influenza, etc. was not reported by the Second Service Command, and three Service Commands (the First, MDW, and Fifth) experienced higher morbidity. The highest admission rate from these causes (129 per thousand) was registered in the First Service Command. Only the Fourth Service Command, with a rate of 77 per thousand, reported morbidity

from these causes of less than 80 per thousand.

Morbidity from pneumonia increased generally. The highest morbidity from this cause was reported by the Sixth Service Command (16 per thousand), and the Military District of Washington was the only other Command with a rate materially in excess of the average for the entire country.

Common Communicable Diseases:

Morbidity due to "new" venereal (excluding EPTS) cases increased sharply in the Second, Fourth, and Eighth Service Commands. The Sixth Service Command, with a rate of 58 per thousand, again reported the highest morbidity from these causes. Rates of about 45 per thousand or more were reported by the First, Second, Third, and Seventh Service Commands. The lowest morbidity (12 per thousand) was reported by the Military District of Washington, and the Ninth Service Command, with a rate of 26 per thousand, was the only other Command to report morbidity under 35 per thousand from these causes.

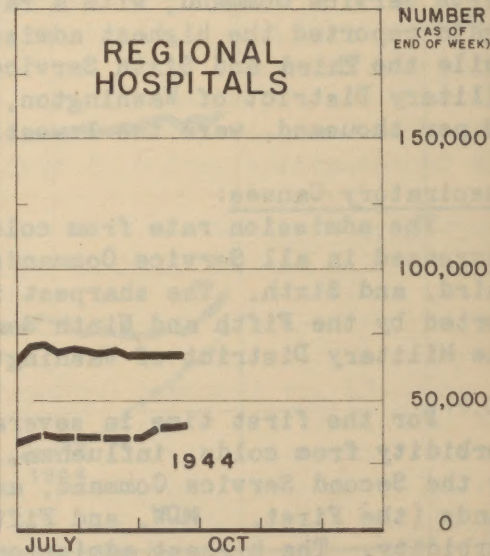

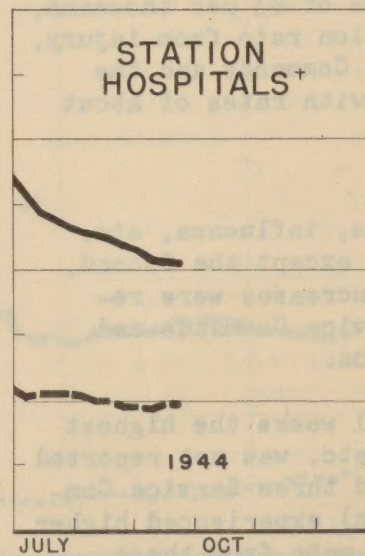

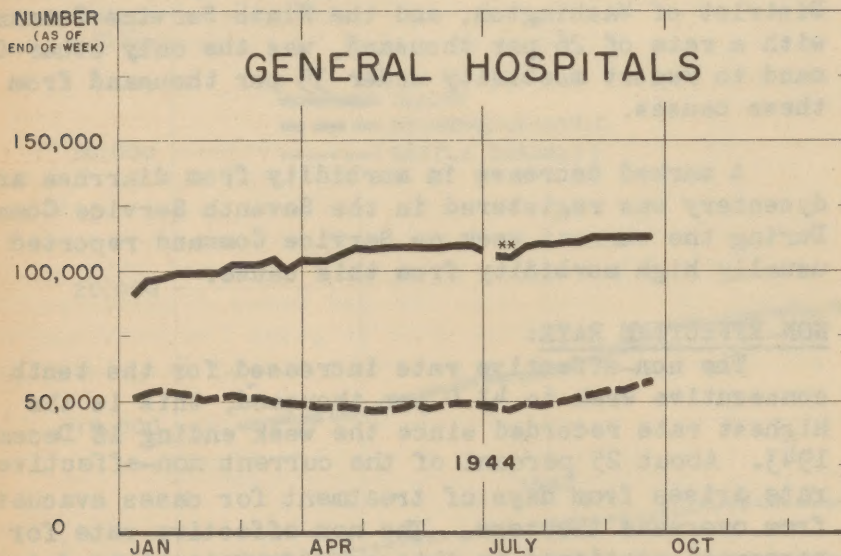

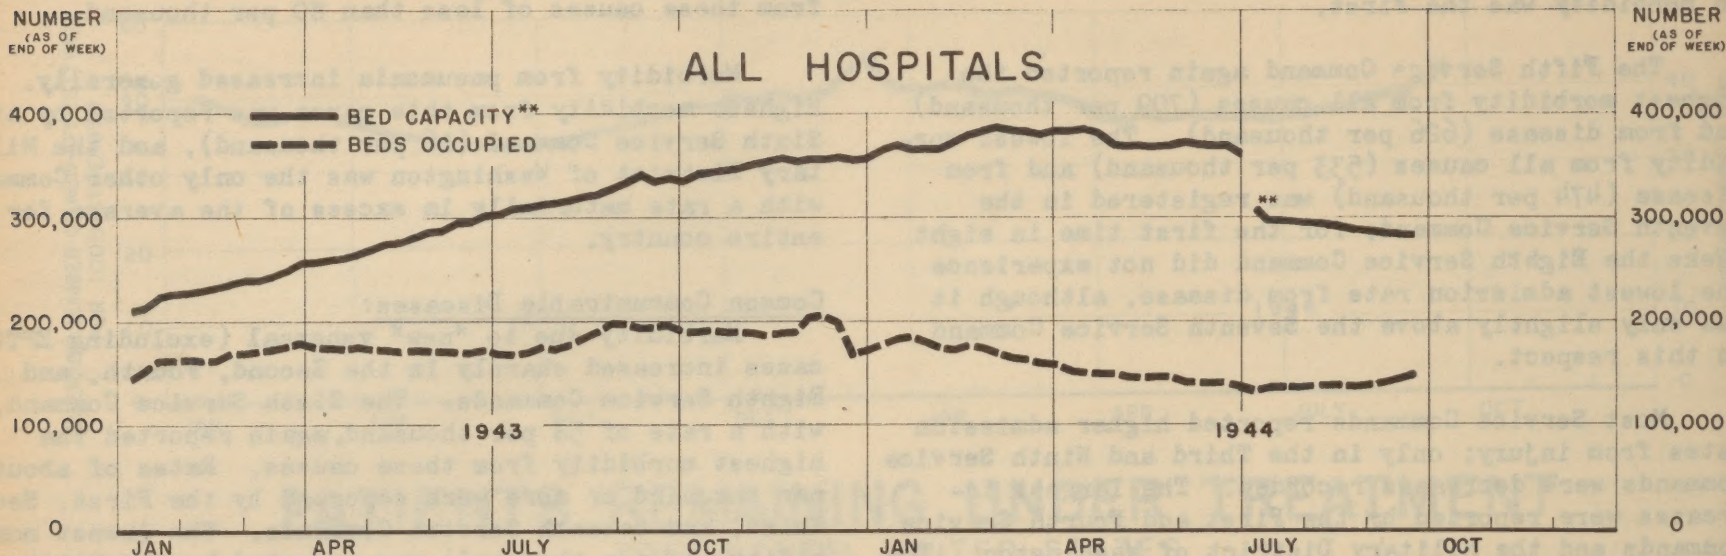

A marked decrease in morbidity from diarrhea and dysentery was registered in the Seventh Service Command. During the current week no Service Command reported unusually high morbidity from this cause.

NON-EFFECTIVE RATE:

The non-effective rate increased for the tenth consecutive week to 43.0 per thousand; this is the highest rate recorded since the week ending 18 December 1943. About 25 percent of the current non-effective rate arises from days of treatment for cases evacuated from overseas theaters. The non-effective rate for personnel stationed in this country is estimated to be lower than in 1943.

HOSPITALIZATION DATA*

CONTINENTAL UNITED STATES

*EXCLUSIVE OF BEDS REPORTED IN DISPENSARIES, CONVALESCENT FACILITIES, VENEREAL DISEASE FACILITIES, AND COLLEGE TRAINING UNITS.

COMMENT ON CURRENT TRENDS (CONT'D)

PATIENTS REMAINING UNDER TREATMENT:

The total number of Army patients remaining in hospital at the end of the week represented a rate of 42.9 per thousand strength. The number of neuropsychiatric cases remaining as of 22 September 1944 was reported at 18,435 or about 1,000 more than the previous week; out of the 18,435 cases 8,983 were in General Hospitals. The number of neuropsychiatric cases remaining was at the highest point during this war.

The number of non-battle injury patients remaining under treatment in hospital and quarters as of 22 September 1944 totaled about 31,600. The number of battle casualty patients remaining increased by about 1,200 to 15,914; all but 275 of these were in General Hospitals.

CERTIFICATES OF DISABILITY FOR DISCHARGE:

During the week ending 22 September 1944 the total number of enlisted men discharged by CDD was 4,823 or about 700 more than the previous week and the highest number recorded since such data have been reported (in July and subsequent). This increase in the number of CDD's is believed to reflect chiefly the effect of liberalized discharge policy announced in WD Circular 370, 12 September 1944. About 41 percent of these discharges were reported by General Hospitals.

CURRENT HOSPITAL CONDITIONS:

The total authorized beds as of 22 September 1944 numbered about 282,000 or 500 less than at the end of the previous week. The total number of beds occupied was 146,000 (or 52 percent of the total beds authorized) which was about 2,500 more than at the end of the previous week.

The total authorized beds in General Hospitals numbered 113,306. The total number of beds occupied in General Hospitals was 56,580 (or 50 percent of the authorized beds) which was about 700 more than at the end of the previous week and the highest number ever reported.

Station Hospitals (as distinct from Regional Hospitals) reported about 102,000 total authorized beds, while Regional Hospitals reported about 67,000 beds. The number of beds occupied at station hospitals was about 49,000 or 48 percent of total authorized beds. The beds occupied at Regional Hospitals numbered about 40,000 or 60 percent of total authorized beds. Eleven stations (Fort Wayne, Mich., Lemoore AAF, Calif., Camp Gruber, Okla., Florence, Ariz., Mitchel Field, N.Y., Brookley Field, Ala., Camp Butner, N.C., Coral Gables, Fla., Camp Rucker, Ala., DeRidder AAB, La. and Camp White, Ore.) reported more beds occupied than authorized beds: the first five of these were in this same category last week.

Included among the station hospitals are eleven which are designated as Convalescent Hospitals (ZI). These hospitals reported 5,696 authorized hospital beds (3,637 occupied) and in addition 13,803 beds in convalescent facilities (2,876 or 21 percent).

The bed capacity of convalescent facilities in General Hospitals was 21,878; the increase of about 100 beds was due to the opening of a convalescent facilities at Rhoads G.H. The total beds occupied in such convalescent facilities was 7,646 or 35 percent of the total bed capacity. The above figures include 10,372 convalescent facilities beds (3,697 occupied) at the six General and Convalescent Hospitals.

On page 27 there are presented summary data on Army and non-Army patients at General Hospitals and at 3 ASF Convalescent Hospitals (ZI) combined as of 22 September 1944. Also shown is a subdivision of hospital beds available in General Hospitals.

FORM SG-902-8 July 1944

RESTRICTED

SUPPLEMENTARY HEALTH REPORT

FOR THE FOUR WEEK PERIOD ENDING 25 AUGUST 1944

VENEREAL DISEASE ADMISSION RATES

This Supplementary Health Report presents a study of venereal disease admission rates by color for the Army in the continental United States reporting on Form 86ab. The data cover the four week period ending 25 August 1944 and are shown for individual stations only where the colored male strength was 1000 or more, with the data for all other units being grouped together within each Service Command.

In considering morbidity from venereal diseases during August, reference should be had to the Supplementary Health Report contained in the Weekly Health Report for the week ending 15 September 1944, in which the August venereal disease admission rates for all Army personnel combined are shown for individual stations. On page 36 of that report there are set forth the numbers of cases remaining under treatment at the end of the month in each Service Command.

The venereal cases remaining under treatment at the end of August accounted for 2.29 percent of all types of cases under treatment. The days lost due to venereal diseases during the four week period ending 25 August 1944 totaled about 93,000 or an average of over 23,000 per week, representing a non-effective rate of .85 per thousand. Of the 93,000 days lost due to venereal diseases, about 39,000 days were attributable to colored males. The resulting non-effective rate from venereal diseases for colored males was 4.5 per thousand, while for all other personnel it was only .54 per thousand.

As compared with the previous month, the August non-effective rate from venereal diseases increased

by almost 10 percent with the increase being smaller for colored males than for all other personnel. This is the first time in 1944 that there has been an interruption in the consistently downward trend in the non-effective rate from venereal diseases, which continued despite an increasing trend in the admission rates from these causes. Nonetheless, the current level of the non-effective rate from venereal diseases is almost 50 percent lower than for January 1944. This decrease in the non-effective rate has been experienced by both colored males and the remainder of the Army.

In considering the variations in venereal non-effective rates by Service Command, it should be kept in mind that such variations reflect not only differences in non-effectiveness between Service Commands, but also to some extent the differences in the extent of the General Hospital facilities in each Service Command. This is especially true of the Military District of Washington, which has an unusually low venereal rate, but because of the location of Walter Reed G. H. in this Command, reports a relatively high venereal non-effective rate.

For all Army personnel combined, morbidity from venereal diseases (excluding cases contracted prior to entry on active service, designated hereafter as EPTS) was at a rate of 36 per thousand in August or slightly higher than in July. For colored males the **August rate** was 175 per thousand, while for all other Army personnel it was only 24 per thousand, both rates being somewhat more than 5 percent higher than in July. Morbidity of colored male personnel from venereal disease, has continued to be about 7 times as high as for all other Army

VENEREAL DISEASE ADMISSION RATES (CONT'D)

personnel.

The August admission rate for syphilis (excluding EPTS cases) among colored males was about 12 times as high as for other Army personnel, whereas for gonorrhea (excluding EPTS cases) the rate for colored males was only 6 times as high. Venereal diseases other than gonorrhea and syphilis (excluding EPTS cases) were practically all reported among the colored males who accounted for over 80 percent of such cases although representing less than 10 percent of the total strength of the Army. The admission rate from such venereal diseases was 14 per thousand for colored males as contrasted with only .2 per thousand for the remainder of the Army.

For all Army personnel combined, morbidity due to venereal EPTS cases, which were predominantly syphilis, was at a rate of 11 per thousand in August, with corresponding figures of 98 and 3 per thousand for colored males and the remainder of the Army, respectively. Variations in the admission rate for venereal EPTS cases reflect entirely the experience among current inductees, so that differences in the incidence of such cases by Service Command or by individual station have little significance. Quite naturally, reception centers report very high rates of admission from venereal EPTS cases, whereas other stations usually show few cases or none at all.

The Second Service Command continued to report by far the highest morbidity for colored males from venereal diseases (excluding EPTS cases), as shown in the chart on page 40. The August rate of 262 per thousand in this Service Command was about 50 percent higher than the August rate for colored males for the country as a whole. The very high morbidity among task force troops not under the jurisdiction of the Second Service Command was in large part responsible for the high rate of this Command. The next highest morbidity for colored troops

was reported by the Fifth and Sixth Service Commands which had rates of about 225 per thousand. The Seventh Service Command and the Military District of Washington (with rates of less than 130 per thousand) reported the lowest morbidity from these causes among colored males.

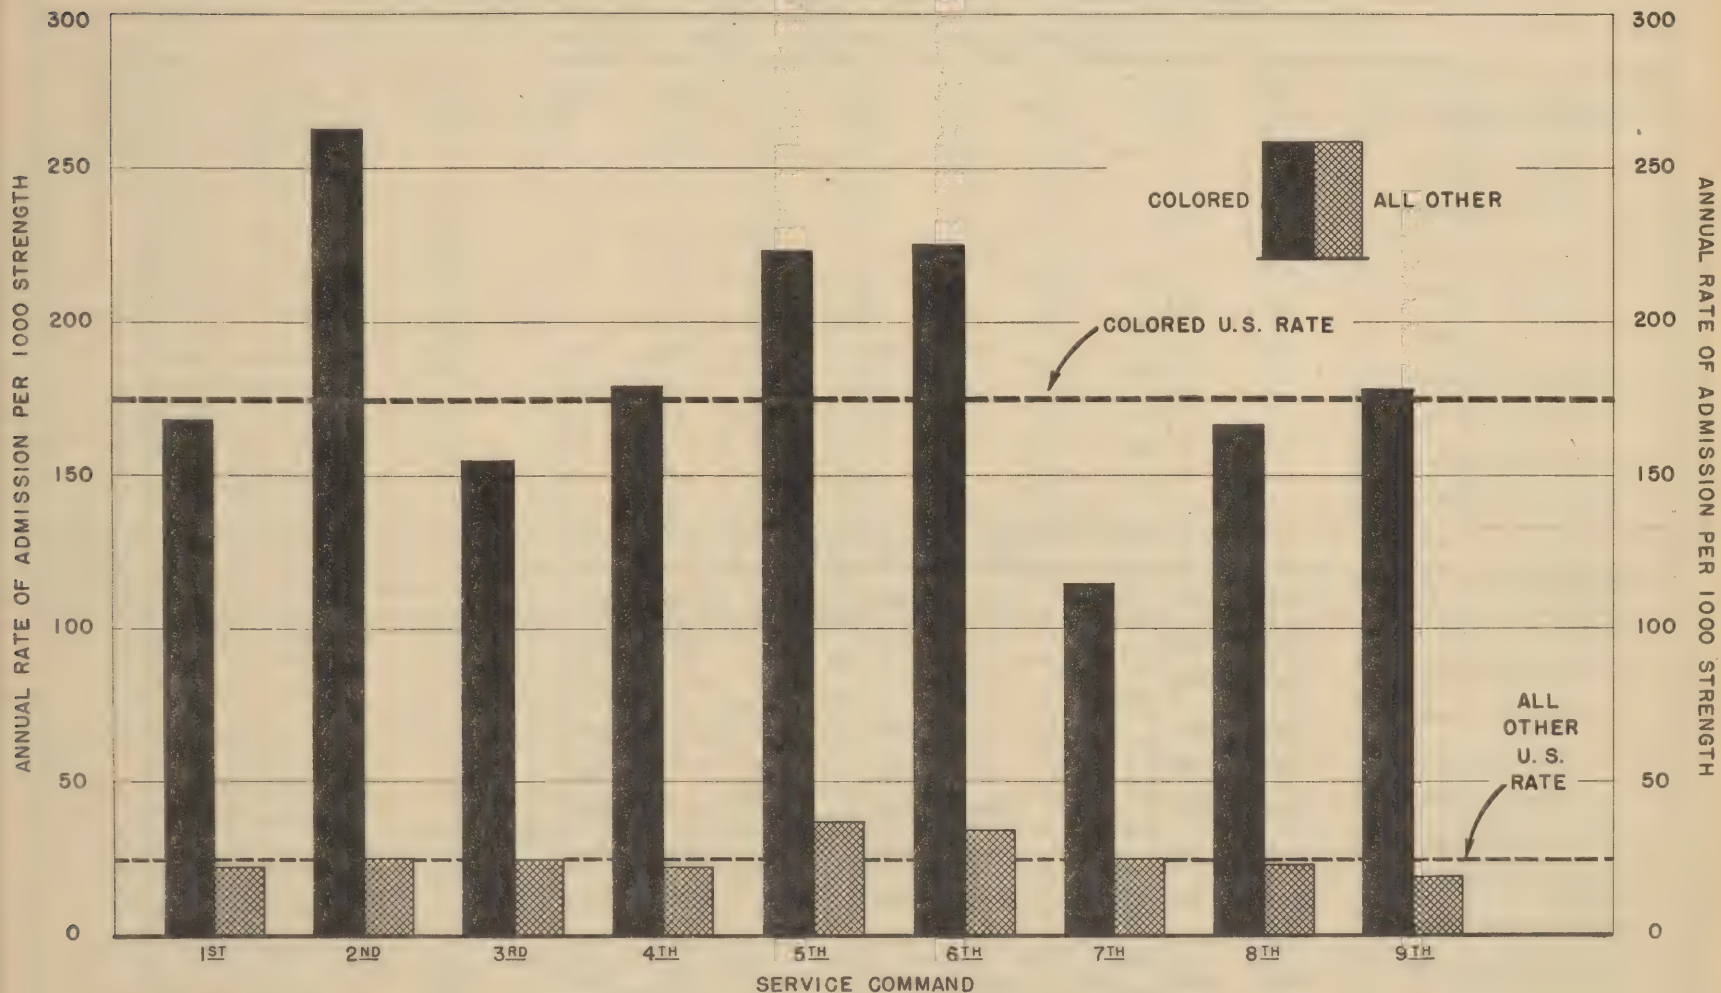

For other Army personnel there was relatively little variation by Service Command in morbidity from venereal diseases (excluding EPTS cases). The Fifth and Sixth Service Commands both had rates of about 35 per thousand, but all other Service Commands reported morbidity rates of 25 per thousand or less. The lowest morbidity was registered by the Military District of Washington and the Ninth Service Command, both of which had rates of about 19 per thousand.

For colored males the following stations reported admission rates in excess of 300 per thousand from total venereal diseases (excluding EPTS cases): Camp Kilmer, N. J., Camp Shanks, N. Y., Camp Butner, N. C., Greensboro AAFORD, N. C., New Orleans PoE, La., Camp Swift, Texas and Camp Beale, Calif. Most of these stations also showed relatively high morbidity in July.

The highest admission rates for syphilis (excluding EPTS cases) among colored males were reported from Camp Edwards, Mass. (105 per thousand) and Camp Gordon Johnston, Fla. (59 per thousand). The highest rates for "other" venereal diseases (excluding EPTS cases) were at Camp Shanks, N. Y. (102 per thousand) and Fort Lawton, Wash. (78 per thousand).

VENEREAL DISEASE (EXCLUDING EPTS CASES) ADMISSION RATES BY SERVICE COMMAND
